yWorks UML Doclet 3.0_01 User's Guide

Contents

1. Introduction

Welcome to the *yWorks UML Doclet User's Guide*.
This guide explains how to use *yWorks UML Doclet* or **yDoc** for short, a javadoc extension (more specifically a doclet/taglet bundle) that provides

- functionality to auto-generate, customize, and include UML diagrams in the API documentation of your Java products
- a filter interface which allows for custom suppression of class, field, or method documentation
- an easy to use mechanism for defining simple custom tags via XML

Although, yDoc is designed in such a way that it allows user's to continue using all the features they know from standard javadoc, some basic knowledge about javadoc usage in general and doclet usage specifically is required to successfully use yDoc.

Detailed information on javadoc is available at http://java.sun.com/j2se/javadoc/.
Detailed information on doclets is available at
http://java.sun.com/j2se/1.5.0/docs/guide/javadoc/doclet/overview.html.

2. System Requirements

yDoc 3.0_01 requires JDK 1.5.0 or JDK 1.6.0 installed on your system.
To view UML class diagrams in SVG or SVGZ format, you either need a browser with native SVG support or a SVG plug-in. For Microsoft Internet Explorer, you can download one such plug-in from the Adobe SVG website. To view UML class diagrams in SWF format, you need a browser with a Flash Player plug-in. Flash Player plug-ins are available from Adobe, too.
If you want to run yDoc under Unix/Linux operating systems, you need to have an X server installed and running, since yDoc makes use of the java awt and/or swing packages (for UML generation only).

3. Installing yDoc

Unzip the yDoc archive (ydoc-3.0_01-jdk1.4.zip or ydoc-3.0_01-jdk1.5.zip respectively) into a directory of your choice. It will create a lib/, a doc/, and a resources/ subdirectory.

The lib directory contains the java classes you need to run the ydoc expansion as jar libraries.

The doc directory contains the yDoc User's Guide in HTML and PDF format, the DocFilter and PathResolver API Documentation in HTML format, and several usage samples.

The resources directory contains various configuration files which you can use to customize the behaviour of the yDoc expansion. See Configuring yDoc and Using the XML driven taglet factory for more details.

4. Running yDoc

Basically you run javadoc. The only difference is, that you tell javadoc to use the facilities provided by yDoc as a plug-in.
Read on for detailed information on how to do that. You can skip this part, if you are already familiar with using custom doclets for javadoc.

Using the yDoc doclet

We recommend running javadoc either using a build tool such as ANT (version 1.5.2 or better) or directly from commandline. Before running javadoc from commandline, put your commandline options into a file called "options" and run javadoc by invoking
   javadoc @options @packages
where "packages" is the filename of a file containing the java packages you want to be documented.

See yDoc Quick Start for simple examples on how to use yDoc.

For detailed documentation on the javadoc options, see the javadoc tool homepage at http://java.sun.com/j2se/javadoc/index.html.

To use the yDoc expansion the following options are especially important:

- **-docletpath** *docletpathlist*
  This option tells javadoc where to look for the yDoc expansion.
  The *docletpathlist* must contain the path to the library ydoc.jar
     `<ydoc_install_dir>/lib/ydoc.jar`
  and the resources directory
     `<ydoc_install_dir>/resources`
  Important:
  If you want to use the yDoc UML generation, *docletpathlist* must also contain the path to your *compiled*, *unobfuscated* Java class files (*.class), for which you want to generate the API documentation, and to all libraries needed to compile your Java source files.
- **-doclet ydoc.doclets.YStandard**
  The -doclet ydoc.doclets.YStandard option finally tells javadoc to actually use the YStandard doclet, which is the core class of the ydoc expansion.

See yDoc Features for information on (custom) commandline options and on how to use the specific capabilites of yDoc.

A sample options file on a Win32 operating system could look like this:

```
-d <destination directory>
-sourcepath <source directory>
-breakiterator
-generic
-umlautogen
-author
-docletpath <YID>/lib/ydoc.jar;<YID>/resources;<some path>/myapp.jar
-doclet ydoc.doclets.YStandard
-filterpath <YID>/lib/ydoc.jar
-filter ydoc.filters.ExcludeFilter
-tagletpath <YID>/lib/ydoc.jar
-tag param
-tag return
```

```
-tag see
-ytag y.uml
```

where **<YID>** denotes the **<ydoc_install_dir>**.
On Unix/Linux operating systems, you will have to use " **:** " as a path separator
instead of " **;** ".

Using the yDoc doclet from within a Java IDE

Running yDoc from within Eclipse 3
1. Select *Export* from the *File* menu.

2. Choose *Javadoc* from *Select an export destination*.
    Go to the next tab.

3. Select *Use Custom Doclet* then specify *Doclet name* and
    Doclet class path.

    Name has to be ydoc.doclets.YStandard and path has to be
    <yid>/lib/ydoc.jar.
    <yid> denotes the absolute path to the yDoc directory.

    Go to the next tab.

4. Add in *Extra Javadoc options*
    -docletpath **<yid>/resources**

    If your sources depend on additional libraries, you also need
    to append the path to these libraries to the above line.

    Any other options you want to use, e.g. -d **<destination>**
    or -umlautogen, need to be specified in this input area, too.

5. Optionally, add -J-Xmx1024m in *VM options*.
    You may want to play with the numerical value depending on
    available RAM and project size.

Running yDoc from within IntelliJ Idea 6
1. Select *Generate JavaDoc ...* from the *Tools* menu.

2. Add in *Other command line arguments*
    -docletpath **"<yid>/lib/ydoc.jar"** -doclet
    ydoc.doclets.YStandard -resourcepath
    "<yid>/resources"
    <yid> denotes the absolute path to the yDoc directory.

    If your sources depend on additional libraries, you also need
    to append the path to these libraries to the -docletpath
    option.

    Any other options you want to use, e.g. -d **<destination>**
    or -umlautogen, need to be specified in this input field, too.

3. Click *Start*.

Running yDoc from within Netbeans 5.5
   1. Switch to *Projects* view.

   2. Open context menu for *Source Packages* (by right clicking).
       Choose *Properties*.

   3. Expand *Build*.
       Choose *Documenting*.

   4. Add in *Additional Javadoc Options*
       -docletpath **"<yid>/lib/ydoc.jar"** -doclet
       ydoc.doclets.YStandard -resourcepath
       "<yid>/resources"
       <yid> denotes the absolute path to the yDoc directory.

       If your sources depend on additional libraries, you also need
       to append the path to these libraries to the -docletpath
       option.

       Any other options you want to use, e.g. -d **<destination>**
       or -umlautogen, need to be specified in this input field, too.

   5. Choose *Generate Javadoc for "<project name>"* from the
       Build menu.

yDoc Quick Start

This section demonstrates how to use yDoc to generate a Javadoc page of a sample
class that will automatically include an UML diagram depicting that class.

- **yDoc from commandline**

  Look in **<YID>/doc/examples** for sample options files and sample Java
  sources to test yDoc.
  All you need to do is invoking javadoc in **<ydoc_install_dir>** with either
      javadoc @doc/examples/options.sample.linux
  or
      javadoc @doc/examples/options.sample.win32
  depending on your operating system.

- **yDoc in ANT**

  Using ANT 1.5.2 or better, you can use ANT's javadoc task to run yDoc.

  Look in **<YID>/doc/examples** for a sample ANT build file and sample Java
  sources to test yDoc.
  All you need to do is invoking ant in **<ydoc_install_dir>** with
      ant -buildfile doc/examples/build-sample.xml test-ydoc

The generated API pages can now be found in

`<ydoc_install_dir>/doc/api/examples`.

Note that the generated UML diagrams are in PNG format. If you want to generate the uml diagrams in a different format (SVG, SVGZ, SWF, GIF, JPG) simply change the value of **formats.fileformat** in the yDoc configuration file **`<ydoc_install_dir>/resources/ydoc.cfg`** accordingly.

The next tutorial step would be to look in **`<ydoc_install_dir>/doc/examples`** for the sample option/build files and sample Java sources which have been used in this example. Once you understand the options and tags, you are ready to use yDoc in your own project.

5. yDoc Features

Generating UML class diagrams

yDoc will generate UML diagrams, if one or more of the following commandline options are used:

- **-umlgen**
- **-umltypegen**
- **-umlpackagegen**
- **-umloverviewgen**
- **-umlautogen**

All UML diagrams feature hyperlinks for the displayed packages, types, and type members, which allow direct access to the corresponding documentation.

See Custom command line options for additional details.

yDoc supports several output formats for UML diagrams, including SVG, SWF, and PNG and will automatically integrate the diagrams into the generated HTML API documentation.
Moreover, yDoc provides many settings which allow to customize the generated UML diagrams in great detail.

See Configuring yDoc for details.

Important:
yDoc uses the Java Reflection API to generate the class diagrams, therefore you need to specify the path to your *compiled, unobfuscated* Java class files (*.class) and to all libraries needed to compile your Java source files in the -docletpath option. Your class files may be located in a jar file.

Alternatively, yDoc can embed predefined diagrams instead of generating them. Predefined diagrams have to be available in GraphML. GraphML is a generic graph interchange file format. Diagrams in this format can, e.g., be created using yEd, yWorks' free graph editor.

For yDoc to be able to find and read such diagrams, a diagram locator has to be specified.

The distribution comes with one predefined diagram locator. For this default locator to work successfully, predefined diagram files have to meet the following criteria:

- Overview diagrams must be in the same directory as your overview.html. The diagram files have to be named `overview <id> .graphml`, where `<id>` denotes the diagram ID (see also Configuring yDoc).
- Package diagrams must be in the same directory as your package.html. The diagram files have to be named `package <id> .graphml`, where `<id>` denotes the diagram ID (see also Configuring yDoc).
- Type diagrams must be in the same directory as the corresponding source file. The diagram files have to follow the same naming convention as the Java source file except for the `.graphml` file extension.

work successfully, predefined diagram files have to meet the following criteria:

To use this default diagram locator, you need to specify the following two commandline options:

    -diagramlocatorpath `<ydoc_install_dir>/lib/ydoc.jar`
    -diagramlocator ydoc.resolvers.DefaultDiagramLocator

To create and use your own diagram locators, all you have to do is implementing the ydoc.resolvers.PathResolver interface and register the locator similar to the above example. The mechanism to register locators works similar to the one used for doclets.

PathResolver API

Documentation for the ydoc.resolvers.PathResolver interface, which comprises the PathResolver API.

General Layout of UML class diagrams
1 **Associations**
      structural relationships between a whole and its parts, i.e. *has a* or *instantiates*
  Every declared field constitutes an association.

2 **Dependencies**
      semantic relationships in which a change to one thing may effect the semantics of the other thing
  There are several heuristics as to what constitues a dependency.
  See Configuring yDoc.

Generalizations

specialization/generalization relationships, i.e. *is a* or
subclass/superclass
For interfaces there may be more than one generalization
relationship.

Realizations

semantic relationships between classifiers, i.e.
interface/implementing class
For interfaces there are no realization relationships.

Using filters

yDoc provides a sophisticated filter framework, which lets you exclude parts of your
API from documentation using customizable filter criteria.

The distribution comes with one predefined filter, which lets you exclude
classes/interfaces, fields, and/or methods from documentation, if their documentation
comment contains an **@y.exclude** tag.
To use this filter, you need to specify the following two commandline options:
  -filterpath **<ydoc_install_dir>/lib/ydoc.jar**
  -filter ydoc.filters.ExcludeFilter

To create and use your own filters, all you have to do is implement the
ydoc.filters.DocFilter interface and register the filter similar to the above example.
The mechanism to register filters works similar to the one used for doclets.

DocFilter API
Documentation for the ydoc.filters.DocFilter interface, which comprises the DocFilter
API.

Using the XML driven taglet factory

By specifying the -generic option, you can tell yDoc to register simple taglets, which
are more powerful than the ones created by the standard -tag option and are defined
in the **resources/taglet_definitions.xml** and
resources/taglet_templates.xml files.
By adding more definitions to those files, you can use/register more simple taglets.

The basic idea is to have template definitions that define taglet behaviour and taglet
definitions that define scope, name, and which template to use.

For examples on how to define taglets, see the two mentioned xml files.

Taglet Definitions
The following XML elements are used to define taglets:

• <taglet>

Each of these elements results in the registration of one particular taglet.
The value of the `name` attribute specifies the javadoc tag for the taglet. The value
of the attribute `allowMultipleTags` specifies if more than one appearance of
the javadoc tag per doc element is allowed. If not, all but the first tag will be
ignored.

- `<usage>`
  Required element that specifies the taglet scope as per the taglet API.
- `<headline>`
  Required root element for `<singular>` and `<plural>`.
- `<singular>`
  Required element that specifies the headline for the tag comment if only one
  javadoc tag or no `<plural>` element is present.
- `<plural>`
  Optional element that specifies the headline for the tag comment if multiple
  javadoc tags are allowed and present.

In general, it is a good idea to use at least one '.' character in the name of custom
tags to avoid potential conflicts/overrides.

Template Definitions

The following XML elements are used to define templates:

- `<template>`
  Each of these elements results in the creation of one particular template.
  The value of the `name` attribute has to be unique among all templates. It is used
  to reference the template in the taglet definition.
- `<headline>`
  Required element that specifies the HTML code for the headline of the tag
  comment.
  You may specify one parameter sign, i.e. #0.
  You may use a single parameter multiple times, e.g. `<headline>`
  `<![CDATA[bla #0 bla#0bla]]></headline>`
  The element should contain unparsed character data, i.e. `<![CDATA[....]]>`
- `<content>`
  Required element that specifies the HTML formatting for the tag comment.
  The value of the `separator` attribute specifies if and how to break down the
  comment into parameters.
  Possible values are:
  - any single character   breaks the comment at each occurance
                                    of the specified character
  - the token "first-whitespace"   breaks the comment at the first
                                    occurance of a whitespace
  - the token "whitespace"   breaks the comment at each occurance
                                    of a whitespace
  - the token "none" (default)   results in one token only, namely the
                                    whole comment
- `<content-item>`
  Required element that specifies the HTML code to wrap the tag comment in. If
  multiple javadoc tag are present for a particular doc element, then one content
  item is created for each tag comment.
  You may specify up to ten parameter signs, i.e. #x, where -1 < x < 10.
  You may use a single parameter multiple times.

The element should contain unparsed character data.
- `<content-sep>`
  Optional element that defaults to "".
  Its value will be inserted between content items.
  The element should contain unparsed character data.
- `<content-start>`
  Optional element that defaults to "".
  Its value will be inserted directly after the headline, before the first content item.
  The element should contain unparsed character data.
- `<content-end>`
  Optional element that defaults to "".
  Its value will be inserted directly after the the last content item.
  The element should contain unparsed character data.

In general, it is a good idea to use the `<DT>` tag for headlines and the `<DD>` tag for content, since all output generated by javadoc taglets appears in definition lists.

Custom command line options

yDoc provides several custom command line options:

- **-diagramlocator** *class*
  Specifies the class file for the diagram locator to be used. Use the fully-qualified name for *class*. Use the -diagramlocatorpath option to specify the path to the diagram locator.
- **-diagramlocatorpath** *-diagramlocatorpathlist*
  Specifies the search paths for finding diagram locator class files (*.class). The *diagramlocatorpathlist* can contain multiple paths separated by the system-dependant path-separator.
- **-filter** *class*
  Specifies the class file for the filter to be applied. Use the fully-qualified name for *class*. Use the -filterpath option to specify the path to the filter.
- **-filterpath** *filterpathlist*
  Specifies the search paths for finding filter class files (*.class). The *filterpathlist* can contain multiple paths separated by the system-dependant path-separator.
- **-generic**
  The taglet definitions in **resources/taglet_definitions.xml** and **resources/taglet_templates.xml** are used to create and register simple taglets.
- **-license** *file*
  Specifies the path to the license file.
- **-resourcepath** *resourcepathlist*
  Specifies the search paths for finding resource files (i.e. taglet definition files, ydoc configuration file, ydoc license file). The *resourcepathlist* can contain multiple paths separated by the system-dependant path-separator.
- **-umlautogen**
  Same as using -umltypegen, -umlpackagegen, and -umloverviewgen in combination
- **-umlfileformat** *formatname*

Overrides the uml_file_format property in `resources/ydoc.cfg`
See the section about UML file formats for a list of supported formats.

- **-umlgen**
  UML diagrams will be created and embedded for all documented files with an **@y.uml** tag.
  @y.uml may be used in type, package, and overview documentation.

- **-umloverviewgen**
  An UML overview diagram will be created and embedded, even if there is no **@y.uml** tag in overview.html.

- **-umlpackagegen**
  UML diagrams will be created and embedded for all documented packages, not only for those with an **@y.uml** tag.

- **-umltypegen**
  UML diagrams will be created and embedded for all documented classes and interfaces, not only for those with an **@y.uml** tag.

- **-ytag**
  Allows to specify the position of custom yDoc tags (i.e. @y.uml or tags defined via the taglet factory) in relation to standard tags.

6. Configuring yDoc

resources/ydoc.cfg

resources/ydoc.cfg is yDoc's main configuration file.
It uses a simple XML format consisting of nested group and property elements.

Following is the complete list of recognized group and property declarations.

Group **diagrams**

Encapsulates settings that determine all aspects of yDoc's UML generating mechanism. These settings are grouped into the categories *overview*, *package*, and *type* in correspondance to the available diagram types.
You may have multiple *diagram* subgroups in each of the above mentioned three categories. For each *diagram* group, one UML diagram will be generated and embedded into the corresponding HTML file.

Group **diagrams.overview.diagram**

- Property style accepts an arbitrary text value interpreted as a file name.
  This property specifies the path to a yDoc style definition file, which determines the visual properties of the generated UML diagram, such as line colors or font sizes.
  See UML Styles for more information.
- Property type accepts one of the following values:

  - dependency
    Dependency diagrams depict package-level dependencies in your project.
  - inheritance
    Inheritance diagrams depict project-wide inheritance trees.

  This property specifies the overview diagram type.
- Property id accepts an arbitrary text value.
  This property specifies a diagram ID, which is used to distinguish between multiple overview diagrams.
  The value of this property has to be unique among all diagrams.overview.diagram ID values.

Group **diagrams.overview.diagram.include**

- Property dependencies accepts one of the following values:

  - all
    All package dependencies are displayed.
  - reduced

No transitive dependencies are displayed.

This property specifies whether transitive dependencies should be displayed.
This property is only respected for overview diagrams of type dependency.

- Property groups accepts values true and false.
  This property specifies whether package nodes should be grouped according to the -group options. If no -group option is used, this property is ignored.
- Property packages accepts values true and false.
  This property specifies whether type nodes should be grouped according to their containing packages.
  This property is only respected for overview diagrams of type inheritance.

Group **diagrams.overview.diagram.insets**

- Property group accepts non-negative integer values.
  This property specifies the distance from a group node's border to the package nodes contained in the group node.
- Property package accepts non-negative integer values.
  This property specifies the distance from a package node's border to the type nodes contained in the package node.

Group **diagrams.overview.diagram.layout**

- Property BUS_ROUTING accepts values true and false.
  This property specifies whether multiple relations (e.g. in the case of a class having multiple subclasses) should be routed in a bus style manner.
- Property CYCLE_LAYERING_POLICY accepts one of the following values:

  - DEFAULT_POLICY
    All backwards relation edges as determined by a depth-first-search on the diagram nodes are temporarily removed for layering.
  - ASSIGN_CYCLES_TO_SAME_LAYER_POLICY
    Diagram nodes with cyclic dependencies are put into the same layer.
  - BREAK_CYCLES_BY_WEIGHT_POLICY
    Cyclic dependencies are resolved by temporarily removing the least significant relation edges for layering.

  This property specifies the layering policy for cyclic dependencies.
- Property GROUP_COMPACTION accepts values true and false.
  This property specifies whether package and group digram nodes should be kept as small as possible.
- Property ORIENTATION accepts one of the following values:

- • TOP_TO_BOTTOM
- • LEFT_TO_RIGHT
- • RIGHT_TO_LEFT
- • BOTTOM_TO_TOP

  This property specifies the layout orientation.
- • Property RECURSIVE_GROUP_LAYERING accepts values true and false.
  This property specifies whether layering should be performed locally on a per group basis or globally for the whole diagram.
  This property is ignored, if the diagram does not contain node groups.
- • Property REVERSE_EDGES accepts values true and false.
  This property specifies whether the direction of relation edges should be reversed during layout calculation.
  Reversing the edge directions does e.g. affect the alignment of the diagram nodes.
- • Property ROUTE_ORTHOGONAL accepts values true and false.
  This property specifies whether relation edges should be routed orthogonally or polyline-style.

Group **diagrams.package.diagram**

- • Property style accepts an arbitrary text value interpreted as a file name.
  This property specifies the path to a yDoc style definition file, which determines the visual properties of the generated UML diagram, such as line colors or font sizes.
  See UML Styles for more information.

Group **diagrams.package.diagram.include**

- • Property packages accepts values true and false.
  This property specifies whether type nodes should be grouped according to their containing package.

Group **diagrams.package.diagram.insets**

- • Property group accepts non-negative integer values.
  This property specifies the distance from a group node's border to the package nodes contained in the group node.
- • Property package accepts non-negative integer values.
  This property specifies the distance from a package node's border to the type nodes contained in the package node.

Group **diagrams.package.diagram.layout**

- • Property BUS_ROUTING accepts values true and false.
  This property specifies whether multiple relations (e.g. in the

case of a class having multiple subclasses) should be routed in a bus style manner.

- Property ORIENTATION accepts one of the following values:
    - TOP_TO_BOTTOM
    - LEFT_TO_RIGHT
    - RIGHT_TO_LEFT
    - BOTTOM_TO_TOP

    This property specifies the layout orientation.
- Property REVERSE_EDGES accepts values true and false.
  This property specifies whether the direction of relation edges should be reversed during layout calculation. Reversing the edge directions does e.g. affect the alignment of the diagram nodes.
- Property ROUTE_ORTHOGONAL accepts values true and false.
  This property specifies whether relation edges should be routed orthogonally or polyline-style.

Group **diagrams.type.diagram**

- Property style accepts an arbitrary text value interpreted as a file name.
  This property specifies the path to a yDoc style definition file, which determines the visual properties of the generated UML diagram, such as line colors or font sizes.
  See UML Styles for more information.

Group **diagrams.type.diagram.exclude.pattern**

- Property associations accepts a pattern text value.
  Type names matching the pattern text will not be displayed among the diagram's association types.
- Property dependencies accepts a pattern text value.
  Type names matching the pattern text will not be displayed among the diagram's dependency types.
- Property generalizations accepts a pattern text value.
  Type names matching the pattern text will not be displayed among the diagram's generalization types.
- Property realizations accepts a pattern text value.
  Type names matching the pattern text will not be displayed among the diagram's realization types.

Pattern text values are a comma-separated list of full-qualified typename patterns where the '?' character denotes a wildcard of length one and the '*' character denotes a wildcard of arbitrary length.

Group **diagrams.type.diagram.include**

- Property associations accepts values true and false.
  This property specifies whether association nodes should be

displayed.
- Property dependencies accepts one of the following values:

    - all
      Any non-primitive type referenced in a type's byte code
      is considered a dependency.
    - none
      No dependency information is calculated.
    - parameters
      Any non-primitive parameter types of constructor and
      method signatures are considered dependencies.
    - parameters-returntype
      Any non-primitive parameter types of constructor and
      method signatures as well as all non-primitive method
      return types are considered dependencies.

    This property specifies the heuristic approach as to what
    constitutes a dependency. Note, that types which are
    associations will not appear as dependencies no matter
    which heuristic is chosen.
- Property packages accepts values true and false.
  This property specifies whether type nodes should be
  grouped according to their containing package.
- Property paramters accepts values true and false.
  This property specifies whether parameter types should be
  displayed in constructor and method signatures.

Group **diagrams.type.diagram.insets**

- Property package accepts non-negative integer values.
  This property specifies the distance from a package node's
  border to the type nodes contained in the package node.

Group **diagrams.type.diagram.order**

- Property fields accepts one of the ordering enumeration
  values.
  This property specifies the order of fields in type diagrams.
- Property constructors accepts one of the ordering
  enumeration values.
  This property specifies the order of constructors in type
  diagrams.
- Property methods accepts one of the ordering enumeration
  values.
  This property specifies the order of methods in type
  diagrams.

The following ordering enumeration values are available:

- lex
  Members are sorted according to their qualified names (and
  signatures in case of constructors and methods).
- lex-ic

Same as *lex*, but case insensitive.
- mod-lex
  Members are sorted according to their modifiers. Modifiers are considered to imply the following order:
  static public < public < static protected < protected < static package-private < package-private < static private < private
  If two (or more) members are equal according to this ordering, they are sorted according to their qualified names (and signatures in case of constructors and methods).
- mod-lex-ic
  Same as *mod-lex*, but case insensitive.

Group **diagrams.type.diagram.layout**

- Property PACKAGE_DISTANCE accepts values non-negative decimal values.
  This property specifies the distance between adjacent package nodes.
- Property RELATION_BUS_ROUTING accepts values true and false.
  This property specifies whether multiple generalization or realization edges should be routed in a bus-style manner.
- Property RELATION_DISTANCE accepts values non-negative decimal values.
  This property specifies the distance between the detailed type node and related type nodes.
- Property RELATION_TYPE_ALIGNMENT accepts one of the following values:

  - LEFT
  - CENTER
  - RIGHT
  - SHORTEST_DISTANCE
    Association nodes will be right aligned, dependency nodes left aligned.
  - LONGEST_DISTANCE
    Association nodes will be left aligned, dependency nodes right aligned.

  This property specifies specifies the alignment policy for association and dependency type nodes. If package nodes are displayed, alignment calculation is done on a per relation package basis.
- Property RELATION_TYPE_DISTANCE accepts values non-negative decimal values.
  This property specifies the distance between adjacent relation type nodes.
- Property RELATION_LABEL_LAYOUT_POLICY accepts one of the following values:

  - AS_IS
    No new label position is calculated.
  - OUTWARDS

For labels outside of a type node a new label position is calculated. For labels belonging to generalization or realization types, the new position is above the node, for labels belonging to association types the new position is to the left of the node, and for labels belonging to dependency types, it is to the right of the node.

This property specifies the label layout policy for labels of relation type nodes.

Group **formats**

Settings related to file formats of the generated UML diagrams and the way they are embedded into the HTML API documentation.

- Property fileformat accepts one of the following values:

  - GIF
    Well-known image format.
  - JPG
    Well-known image format.
  - PNG
    Well-known image format, the default.
  - SVG
    Scalable Vector Graphics, a XML-based vector graphics format.
  - SVGZ
    Compressed *SVG*.
  - SWF
    Shockwave Flash, a popular binary vector graphics format.

  This property specifies the file format for the generated UML diagrams.

Group **formats.vectorgraphics.display**

- Property scaling accepts one of the following values:

  - FIXED_SIZE
    The diagram will be displayed in a fixed size canvas (specified by properties width and height).
  - ACTUAL_SIZE
    The diagram will be displayed in a canvas sized to the diagram's actual size.
    This mode ignores properties width and height.
  - ACTUAL_SIZE_MAX_WIDTH
    The diagram will be displayed in a canvas sized to the diagram's actual size up to a fixed canvas width specified by property width).
    This mode ignores property height.
  - ACTUAL_SIZE_MAX_HEIGHT
    The diagram will be displayed in a canvas sized to the

diagram's actual size up to a fixed canvas height
(specified by property height).
This mode ignores property width.

- ACTUAL_SIZE_MAX_WIDTH_MAX_HEIGHT
The diagram will be displayed in a canvas sized to the
diagram's actual size up to a fixed canvas size (specified
by properties width and height).
- FIT_TO_SIZE
The diagram will be scaled to fit into a canvas with fixed
width and fixed height (specified by properties width and
height).
- FIT_TO_SIZE_BY_WIDTH
The diagram will be scaled to fit into a canvas with fixed
width (specified by property width).
This mode ignores property height
- FIT_TO_SIZE_BY_HEIGHT
The diagram will be scaled to fit into a canvas with fixed
height (specified by property height).
This mode ignores property width.
- SHRINK_TO_SIZE
The diagram will be scaled to fit into a canvas with fixed
width and fixed height (specified by properties width and
height), unless it already fits.
- SHRINK_TO_SIZE_BY_WIDTH
The diagram will be scaled to fit into a canvas with fixed
width (specified by property width), unless it already fits.
This mode ignores property height.
- SHRINK_TO_SIZE_BY_HEIGHT
The diagram will be scaled to fit into a canvas with fixed
height (specified by property height), unless it already
fits.
This mode ignores width.

This property specifies the display scaling policy for UML
diagrams. All policies will retain the diagram's original aspect
ratio.
- Property width accepts positive integer values.
This property specifies the canvas width for the generated
UML diagram.
- Property height accepts positive integer values.
This property specifies the canvas height for the generated
UML diagram.
- Property reserveMinimum accepts values true and false.
This property specifies whether yDoc should reserve a
canvas at least the size of width and height when embedding
UML diagrams into HTML API documentation.

Group **formats.vectorgraphics.svg**

- Property workaround accepts values true and false.
This property specifies whether yDoc should use alternative
HTML code for SVG embedding.

Due to changes in the plug-ins API in the gecko code base, the current version of the Adobe SVG Plugin 3.0 crashes browsers of the gecko family (Mozilla, Netscape 6+7, ...) when displaying HTML with embedded SVG images.
There is an experimental workaround by wrapping the <EMBED> tag(s) in <IFRAME> tags, albeit with a significant disadvantage: It is no longer possible to use javascript based hyperlinks in SVG, which are neccessary to make URI fragments work properly.

Group **formats.image**

- Property quality accepts values ranging from 0.0 to 1.0.
  This property specifies the compression quality for image formats that support compression (e.g. PNG, JPG).
  A compression quality setting of 0.0 is most generically interpreted as *high compression is important*, while a setting of 1.0 is most generically interpreted as *high image quality is important*.
- Property antialiasing accepts values true and false.
  This property specifies whether anti aliasing should be used in UML diagram image files.
- Property progressive accepts values true and false.
  This property specifies whether UML diagram image files should be encoded in progressive mode for image formats that support progressive encoding.
  Progressive encoding will result in image streams containing a series of scans of increasing quality.

Group **formats.image.tiling**

- Property enabled accepts values true and false.
  This property specifies whether UML diagrams should be written to multiple small image files instead of a single large one, if the image's width or height exceeds the corresponding maximum.
- Property width accepts non-negative integer values.
  This property specifies the maximum width for UML diagram image tiles.
- Property height accepts non-negative integer values.
  This property specifies the maximum height for UML diagram image tiles.

Group **misc**

- Property warnings accepts values true and false.
  This property specifies whether yDoc should emit warnings each time an explicit link (i.e. the result of @see or @link) to a documentation member, which was not accepted by the registered filters, is suppressed.

Group **misc.gc**

- Property frequency accepts non-negative integer values.
  This property specifies the number of UML diagrams to be
  generated between explicit calls to the Java garbage
  collector. A value of 10, for example, would result in a call to
  the garbage collector after every tenth diagram, whereas a
  value of 1 will call garbage collection after each diagram.
  A value of 0 will prevent yDoc from explicitly calling the Java
  garbage collector.

UML Styles

A style set defines the visual features of UML diagrams and is specified in a XML file
which conforms to the yDoc style definition schema.
The yDoc distribution comes with several predefined style files, see
`resources/styles`.
You can customize colors (main, border, text), fonts, shapes, and lines by either
modifying an existing style file or creating a new one.
The yDoc 3.0_01 distribution includes StyleEd, a GUI-based style editor, that greatly
simplifies customization. The editor is completely written in Java and will run on any
Java 1.4.x or higher platform. All files needed to run StyleEd are contained in the
executable JAR file `lib/styleed.jar`, i.e. double-clicking the file or invoking
java -jar <YID>/lib/styleed.jar
will start StyleEd.
Aside from style file editing, StyleEd also allows users to experiment with layout
settings for the various diagram types.

7. Limitations

- The yDoc Evaluation version will only document ten classes.
  If one or more of those are excluded from documentation via the @y.exclude
  tag, they still count against that limit.
- In UML class diagrams generated by the yDoc Evaluation version, the
  associations list and the dependencies list will only display the ten above
  mentioned classes.

8. Acknowledgments

This product includes software developed by the Apache Software Foundation
(http://www.apache.org/).
yDoc uses Batik to generate SVG files. Batik is distributed under the Apache
Software License, Version 2.0:

```
                          Apache License

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

   "License" shall mean the terms and conditions for use, reproduction,
   and distribution as defined by Sections 1 through 9 of this document.

   "Licensor" shall mean the copyright owner or entity authorized by
   the copyright owner that is granting the License.

   "Legal Entity" shall mean the union of the acting entity and all
   other entities that control, are controlled by, or are under common
   control with that entity. For the purposes of this definition,
   "control" means (i) the power, direct or indirect, to cause the
   direction or management of such entity, whether by contract or
   otherwise, or (ii) ownership of fifty percent (50%) or more of the
   outstanding shares, or (iii) beneficial ownership of such entity.

   "You" (or "Your") shall mean an individual or Legal Entity
   exercising permissions granted by this License.

   "Source" form shall mean the preferred form for making modifications,
   including but not limited to software source code, documentation
   source, and configuration files.

   "Object" form shall mean any form resulting from mechanical
   transformation or translation of a Source form, including but
   not limited to compiled object code, generated documentation,
   and conversions to other media types.

   "Work" shall mean the work of authorship, whether in Source or
   Object form, made available under the License, as indicated by a
   copyright notice that is included in or attached to the work
   (an example is provided in the Appendix below).

   "Derivative Works" shall mean any work, whether in Source or Object
   form, that is based on (or derived from) the Work and for which the
   editorial revisions, annotations, elaborations, or other modifications
   represent, as a whole, an original work of authorship. For the purposes
   of this License, Derivative Works shall not include works that remain
   separable from, or merely link (or bind by name) to the interfaces of,
   the Work and Derivative Works thereof.

   "Contribution" shall mean any work of authorship, including
   the original version of the Work and any modifications or additions
   to that Work or Derivative Works thereof, that is intentionally
   submitted to Licensor for inclusion in the Work by the copyright owner
   or by an individual or Legal Entity authorized to submit on behalf of
   the copyright owner. For the purposes of this definition, "submitted"
   means any form of electronic, verbal, or written communication sent
   to the Licensor or its representatives, including but not limited to
   communication on electronic mailing lists, source code control systems,
   and issue tracking systems that are managed by, or on behalf of, the
   Licensor for the purpose of discussing and improving the Work, but
   excluding communication that is conspicuously marked or otherwise
   designated in writing by the copyright owner as "Not a Contribution."

   "Contributor" shall mean Licensor and any individual or Legal Entity
   on behalf of whom a Contribution has been received by Licensor and
   subsequently incorporated within the Work.
```

2. Grant of Copyright License. Subject to the terms and conditions of
   this License, each Contributor hereby grants to You a perpetual,
   worldwide, non-exclusive, no-charge, royalty-free, irrevocable
   copyright license to reproduce, prepare Derivative Works of,
   publicly display, publicly perform, sublicense, and distribute the
   Work and such Derivative Works in Source or Object form.

3. Grant of Patent License. Subject to the terms and conditions of
   this License, each Contributor hereby grants to You a perpetual,
   worldwide, non-exclusive, no-charge, royalty-free, irrevocable
   (except as stated in this section) patent license to make, have made,
   use, offer to sell, sell, import, and otherwise transfer the Work,
   where such license applies only to those patent claims licensable
   by such Contributor that are necessarily infringed by their
   Contribution(s) alone or by combination of their Contribution(s)
   with the Work to which such Contribution(s) was submitted. If You
   institute patent litigation against any entity (including a
   cross-claim or counterclaim in a lawsuit) alleging that the Work
   or a Contribution incorporated within the Work constitutes direct
   or contributory patent infringement, then any patent licenses
   granted to You under this License for that Work shall terminate
   as of the date such litigation is filed.

4. Redistribution. You may reproduce and distribute copies of the
   Work or Derivative Works thereof in any medium, with or without
   modifications, and in Source or Object form, provided that You
   meet the following conditions:

   (a) You must give any other recipients of the Work or
       Derivative Works a copy of this License; and

   (b) You must cause any modified files to carry prominent notices
       stating that You changed the files; and

   (c) You must retain, in the Source form of any Derivative Works
       that You distribute, all copyright, patent, trademark, and
       attribution notices from the Source form of the Work,
       excluding those notices that do not pertain to any part of
       the Derivative Works; and

   (d) If the Work includes a "NOTICE" text file as part of its
       distribution, then any Derivative Works that You distribute must
       include a readable copy of the attribution notices contained
       within such NOTICE file, excluding those notices that do not
       pertain to any part of the Derivative Works, in at least one
       of the following places: within a NOTICE text file distributed
       as part of the Derivative Works; within the Source form or
       documentation, if provided along with the Derivative Works; or,
       within a display generated by the Derivative Works, if and
       wherever such third-party notices normally appear. The contents
       of the NOTICE file are for informational purposes only and
       do not modify the License. You may add Your own attribution
       notices within Derivative Works that You distribute, alongside
       or as an addendum to the NOTICE text from the Work, provided
       that such additional attribution notices cannot be construed
       as modifying the License.

   You may add Your own copyright statement to Your modifications and
   may provide additional or different license terms and conditions
   for use, reproduction, or distribution of Your modifications, or
   for any such Derivative Works as a whole, provided Your use,
   reproduction, and distribution of the Work otherwise complies with
   the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise,
   any Contribution intentionally submitted for inclusion in the Work
   by You to the Licensor shall be under the terms and conditions of
   this License, without any additional terms or conditions.
   Notwithstanding the above, nothing herein shall supersede or modify
   the terms of any separate license agreement you may have executed
   with Licensor regarding such Contributions.

6. Trademarks. This License does not grant permission to use the trade
   names, trademarks, service marks, or product names of the Licensor,
   except as required for reasonable and customary use in describing the

origin of the Work and reproducing the content of the NOTICE file.

7. Disclaimer of Warranty. Unless required by applicable law or
   agreed to in writing, Licensor provides the Work (and each
   Contributor provides its Contributions) on an "AS IS" BASIS,
   WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or
   implied, including, without limitation, any warranties or conditions
   of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A
   PARTICULAR PURPOSE. You are solely responsible for determining the
   appropriateness of using or redistributing the Work and assume any
   risks associated with Your exercise of permissions under this License.

8. Limitation of Liability. In no event and under no legal theory,
   whether in tort (including negligence), contract, or otherwise,
   unless required by applicable law (such as deliberate and grossly
   negligent acts) or agreed to in writing, shall any Contributor be
   liable to You for damages, including any direct, indirect, special,
   incidental, or consequential damages of any character arising as a
   result of this License or out of the use or inability to use the
   Work (including but not limited to damages for loss of goodwill,
   work stoppage, computer failure or malfunction, or any and all
   other commercial damages or losses), even if such Contributor
   has been advised of the possibility of such damages.

9. Accepting Warranty or Additional Liability. While redistributing
   the Work or Derivative Works thereof, You may choose to offer,
   and charge a fee for, acceptance of support, warranty, indemnity,
   or other liability obligations and/or rights consistent with this
   License. However, in accepting such obligations, You may act only
   on Your own behalf and on Your sole responsibility, not on behalf
   of any other Contributor, and only if You agree to indemnify,
   defend, and hold each Contributor harmless for any liability
   incurred by, or claims asserted against, such Contributor by reason
   of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITIONS

APPENDIX: How to apply the Apache License to your work.

   To apply the Apache License to your work, attach the following
   boilerplate notice, with the fields enclosed by brackets "[]"
   replaced with your own identifying information. (Don't include
   the brackets!) The text should be enclosed in the appropriate
   comment syntax for the file format. We also recommend that a
   file or class name and description of purpose be included on the
   same "printed page" as the copyright notice for easier
   identification within third-party archives.
