iOS Workshop App

If you haven't already, checkout the Xcode project:
https://github.com/kyleturner/ios-workshop
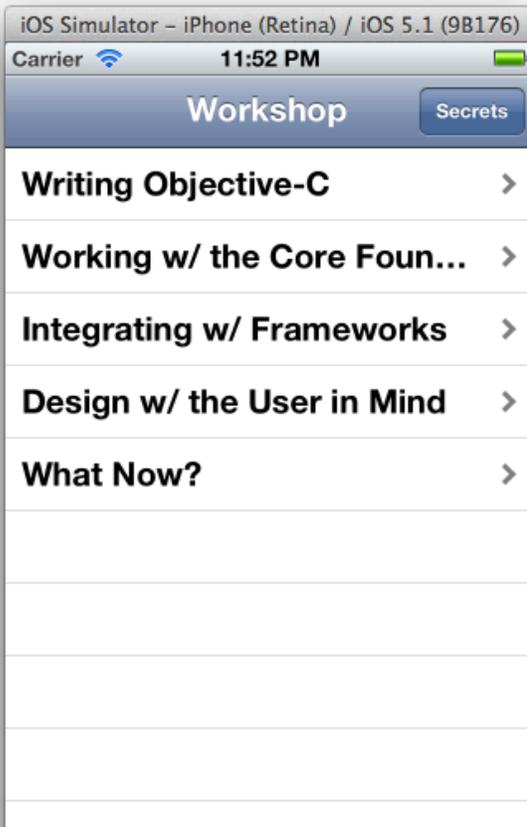

We will be building a "Workshop" application that lists out lessons for a beginning iOS developer to follow.

When a user selects a particular lesson from the list, a view controller with a web view will be pushed onto the view stack, pointing to a handy resource in Apple's lovely developer documentation.
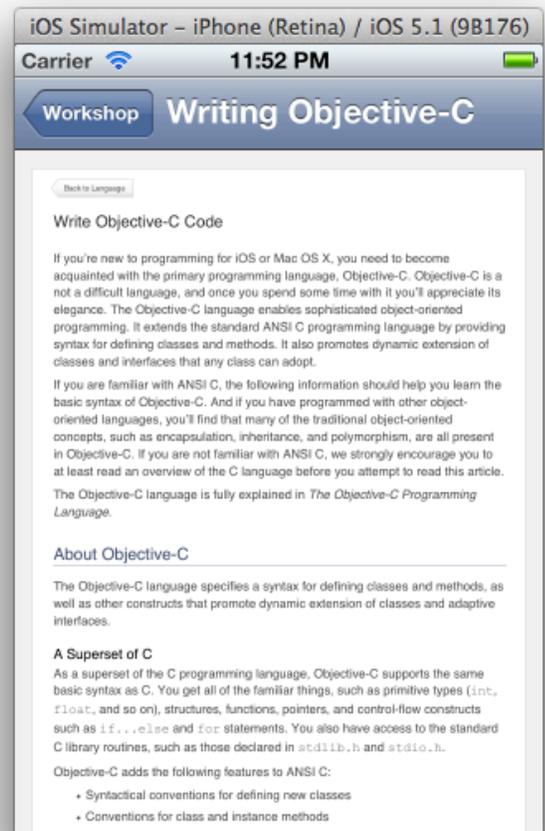

We will be using a model object called WSLesson. Each lesson will have a *title* and a *URL* associated with it.
